

Example 1. Show that the positive integers of the form $4n + 3$, that is, the integers

$$3, 7, 11, 15, 19, \dots$$

cannot be written as the sum of two perfect squares.

Summary — Show that the squares leave a remainder of 0 or 1 upon division by 4. Conclude that a sum of two squares leaves a remainder of 0, 1, 2 upon division by 4.

Walkthrough.

(a) Consider the integers

$$\begin{aligned} &0^2 + 1^2, 0^2 + 2^2, 0^2 + 3^2, 0^2 + 4^2, \dots, \\ &1^2 + 1^2, 1^2 + 2^2, 1^2 + 3^2, 1^2 + 4^2, \dots, \\ &2^2 + 1^2, 2^2 + 2^2, 2^2 + 3^2, 2^2 + 4^2, \dots, \\ &3^2 + 1^2, 3^2 + 2^2, 3^2 + 3^2, 3^2 + 4^2, \dots, \\ &4^2 + 1^2, 4^2 + 2^2, 4^2 + 3^2, 4^2 + 4^2, \dots \end{aligned}$$

(b) Observe that upon division by 4, they leave the integers 0, 1, 2 as remainders.

$$\begin{aligned} &0^2 + 1^2 \rightsquigarrow \mathbf{1}, 0^2 + 2^2 \rightsquigarrow \mathbf{0}, 0^2 + 3^2 \rightsquigarrow \mathbf{1}, 0^2 + 4^2 \rightsquigarrow \mathbf{0}, \dots, \\ &1^2 + 1^2 \rightsquigarrow \mathbf{2}, 1^2 + 2^2 \rightsquigarrow \mathbf{1}, 1^2 + 3^2 \rightsquigarrow \mathbf{2}, 1^2 + 4^2 \rightsquigarrow \mathbf{1}, \dots, \\ &2^2 + 1^2 \rightsquigarrow \mathbf{1}, 2^2 + 2^2 \rightsquigarrow \mathbf{0}, 2^2 + 3^2 \rightsquigarrow \mathbf{1}, 2^2 + 4^2 \rightsquigarrow \mathbf{0}, \dots, \\ &3^2 + 1^2 \rightsquigarrow \mathbf{2}, 3^2 + 2^2 \rightsquigarrow \mathbf{1}, 3^2 + 3^2 \rightsquigarrow \mathbf{2}, 3^2 + 4^2 \rightsquigarrow \mathbf{1}, \dots, \\ &4^2 + 1^2 \rightsquigarrow \mathbf{1}, 4^2 + 2^2 \rightsquigarrow \mathbf{0}, 4^2 + 3^2 \rightsquigarrow \mathbf{1}, 4^2 + 4^2 \rightsquigarrow \mathbf{0}, \dots \end{aligned}$$

(c) Show that it is **always** the case, namely, upon division by 4, the sum of two perfect squares leaves one of 0, 1, 2 as the remainder.

(d) Conclude that no integer, which leaves the remainder of 3 **upon division by 4**, can be written as the sum of two squares.

Solution 1. The solution hinges on the following claim:

Claim — For any integer x , the integer x^2 leaves a remainder of 0 or 1 upon division by 4.

Proof of the claim. Let x be an integer. Let us consider the following cases.

1. Upon division by 4, x leaves a remainder of 0.
2. Upon division by 4, x leaves a remainder of 1.
3. Upon division by 4, x leaves a remainder of 2.
4. Upon division by 4, x leaves a remainder of 3.

In the first case, x is a multiple of 4, and hence x^2 leaves a remainder of 0 upon division by 4. Similarly, in the third case, x is a multiple¹ of 2, i.e. x is equal to $2k$, and hence x^2 is a multiple of 4.

In the second case, x is equal to $4k + 1$ for some integer k . Note that

$$\begin{aligned}x^2 &= (4k + 1)^2 \\&= (4k)^2 + 2 \cdot 4k + 1 \\&= 4(4k^2 + 2k) + 1,\end{aligned}$$

and hence x^2 leaves a remainder of 1 upon division by 4.

In the fourth case, x is equal to $4k + 3$ for some integer k . Note that

$$\begin{aligned}x^2 &= (4k + 3)^2 \\&= (4k)^2 + 2 \cdot 4k \cdot 3 + 9 \\&= 4(4k^2 + 6k + 2) + 1,\end{aligned}$$

and hence x^2 leaves a remainder of 1 upon division by 4.

This proves the claim. □

Using the claim, it follows that a sum of two squares leaves one of 0, 1, 2 as a remainder upon division by 4. Hence, no integer of the form $4n + 3$ can be expressed as a sum of two perfect squares. ■

¹Is it clear?
