

Example 1 (cf. Australian Mathematics Competition 1984). Suppose

$$x_1, x_2, x_3, x_4, \dots$$

is a sequence of integers satisfying the following properties:

- (1) $x_2 = 2$,
- (2) $x_{mn} = x_m x_n$ for all positive integers m, n ,
- (3) $x_m < x_n$ for any positive integers m, n with $m < n$.

Find x_{2024} .

Summary — Observe that $x_{2^n} = 2^n$ for any $n \geq 1$. Combining this with the hypothesis that $\{x_n\}_{n \geq 1}$ is an increasing sequence of **positive integers**, conclude that $x_n = n$ for any $n \geq 1$.

Walkthrough —

- (a) What can be said about x_4, x_8, x_{16}, x_{32} ?
- (b) Note that $x_4 = x_{2 \times 2}, x_8 = x_{4 \times 2}, x_{16} = x_{8 \times 2}, x_{32} = x_{16 \times 2}$.
- (c) Can one show that $x_{2^n} = 2^n$ for any $n \geq 1$?
- (d) Show that $x_m = m$ for any $m \geq 1$ (does property (3) help?).

Solution 1. From the second condition, we obtain

$$x_{2^n} = x_2^n$$

for any integer $n \geq 1$. Using the first condition, it gives

$$x_{2^n} = 2^n$$

for any integer $n \geq 1$. Since $\{x_n\}_{n \geq 1}$ is an increasing sequence of **positive integers**, it follows that $x_n = n$ for any positive integer n . This gives

$$x_{2024} = 2024.$$
