**Example 1.** Show that the positive integers of the form 4n + 3, that is, the integers

$$3, 7, 11, 15, 19, \dots$$

cannot be written as the sum of two perfect squares.

**Summary** — Show that the squares leave a remainder of 0 or 1 upon division by 4. Conclude that a sum of two squares leaves a remainder of 0, 1, 2 upon division by 4.

## Walkthrough —

(a) Consider the integers

$$0^{2} + 1^{2}, 0^{2} + 2^{2}, 0^{2} + 3^{2}, 0^{2} + 4^{2}, \dots, 
1^{2} + 1^{2}, 1^{2} + 2^{2}, 1^{2} + 3^{2}, 1^{2} + 4^{2}, \dots, 
2^{2} + 1^{2}, 2^{2} + 2^{2}, 2^{2} + 3^{2}, 2^{2} + 4^{2}, \dots, 
3^{2} + 1^{2}, 3^{2} + 2^{2}, 3^{2} + 3^{2}, 3^{2} + 4^{2}, \dots, 
4^{2} + 1^{2}, 4^{2} + 2^{2}, 4^{2} + 3^{2}, 4^{2} + 4^{2}, \dots$$

(b) Observe that upon division by 4, they leave the integers 0, 1, 2 as remainders.

$$0^{2} + 1^{2} \rightsquigarrow \mathbf{1}, 0^{2} + 2^{2} \rightsquigarrow \mathbf{0}, 0^{2} + 3^{2} \rightsquigarrow \mathbf{1}, 0^{2} + 4^{2} \rightsquigarrow \mathbf{0}, \dots,$$
 $1^{2} + 1^{2} \rightsquigarrow \mathbf{2}, 1^{2} + 2^{2} \rightsquigarrow \mathbf{1}, 1^{2} + 3^{2} \rightsquigarrow \mathbf{2}, 1^{2} + 4^{2} \rightsquigarrow \mathbf{1}, \dots,$ 
 $2^{2} + 1^{2} \rightsquigarrow \mathbf{1}, 2^{2} + 2^{2} \rightsquigarrow \mathbf{0}, 2^{2} + 3^{2} \rightsquigarrow \mathbf{1}, 2^{2} + 4^{2} \rightsquigarrow \mathbf{0}, \dots,$ 
 $3^{2} + 1^{2} \rightsquigarrow \mathbf{2}, 3^{2} + 2^{2} \rightsquigarrow \mathbf{1}, 3^{2} + 3^{2} \rightsquigarrow \mathbf{2}, 3^{2} + 4^{2} \rightsquigarrow \mathbf{1}, \dots,$ 
 $4^{2} + 1^{2} \rightsquigarrow \mathbf{1}, 4^{2} + 2^{2} \rightsquigarrow \mathbf{0}, 4^{2} + 3^{2} \rightsquigarrow \mathbf{1}, 4^{2} + 4^{2} \rightsquigarrow \mathbf{0}$ 

- (c) Show that it is always the case, namely, upon division by 4, the sum of two perfect squares leaves one of 0, 1, 2 as the remainder.
- (d) Conclude that no integer, which leaves the remainder of 3 upon division by 4, can be written as the sum of two squares.

**Solution 1.** The solution relies on the following claim.

**Claim** — For any integer x, the integer  $x^2$  leaves a remainder of 0 or 1 upon division by 4.

*Proof of the claim.* Let x be an integer. Let us consider the following cases.

- 1. Upon division by 4, x leaves a remainder of 0.
- 2. Upon division by 4, x leaves a remainder of 1.
- 3. Upon division by 4, x leaves a remainder of 2.
- 4. Upon division by 4, x leaves a remainder of 3.

In the first case, x is a multiple of 4, and hence  $x^2$  leaves a remainder of 0 upon division by 4. Similarly, in the third case, x is a multiple of 2, i.e. x is equal to 2k, and hence  $x^2$  is a multiple of 4.

In the second case, x is equal to 4k + 1 for some integer k. Note that

$$x^{2} = (4k + 1)^{2}$$
$$= (4k)^{2} + 2 \cdot 4k + 1$$
$$= 4(4k^{2} + 2k) + 1,$$

and hence  $x^2$  leaves a remainder of 1 upon division by 4.

In the fourth case, x is equal to 4k + 3 for some integer k. Note that

$$x^{2} = (4k + 3)^{2}$$
$$= (4k)^{2} + 2 \cdot 4k \cdot 3 + 9$$
$$= 4(4k^{+}6k + 2) + 1,$$

and hence  $x^2$  leaves a remainder of 1 upon division by 4.

This proves the claim.

Using the claim, it follows that a sum of two squares leaves one of 0, 1, 2 as a remainder upon division by 4. Hence, no integer of the form 4n + 3 can be expressed as a sum of two perfect squares.

<sup>&</sup>lt;sup>1</sup>Is it clear?
